CSS – Border Images

Border-image property

- The **border-image** CSS property allows drawing an image on the borders of elements.

- The property has three parts:
  - The image to use as the border
  - Where to slice the image
  - Define whether the middle sections should be repeated or stretched

- We will use the following image (called "border.png"):

Repeat property

The image is sliced and simply tiled to fill the border area.
<div id="round">The image is tiled (repeated) to fill the area.
</div>

```
#repeat
{
  border: 15px solid;
  border-image:
     url("/files/4127/border.png") 30 30 repeat;
  }
```

Live Sample:

The image is tiled (repeated) to fill the area.

Round property

The round option is a variation on the repeat option that distributes the tiles in such a way that the ends nicely connect.

#round

{

border: 15px solid;

border-image:url("/files/4127/border.png") 30 30 round;

}

Live Sample:

The image is tiled (repeated) to fill the area.

Stretch property

The 'stretch' option stretches the images to fill the border area.

```
#stretch
{
  border: 15px solid;
  border-image:
    url("/files/4127/border.png") 30 30 stretch;
}
```

Live Sample:

The image is stretched to fill the area.
